

# HOW TO REPLACE A TOILET SEAT

When changing a toilet seat be very careful if the bolts are rusted and frozen. Apply liberal amounts of a penetrating lubricant on the bolts and allow to sit over night. Then use a long-handled adjustable wrench. NEVER hit the bolts with a hammer in an attempt to break them. The toilet is the only thing that will break!! As a last resort, spray a lubricant on the top and bottoms of metal bolts. Then place a thin-bladed putty knife between a hack saw blade and the china toilet bowl rim and saw through the bolts with the hack saw. Plastic bolts that become dethreaded will also need to be cut off with the hack saw.
